Sutra Plugins

What SutraPay for Razorpay can do

Getting started · https://sutraplugins.com/docs/sutrapay-for-razorpay/razorpay-features/

SutraPay for Razorpay connects WooCommerce to your own Razorpay account.

Payments

- Razorpay Standard Checkout as a popup on the order "Pay" page, or on its own page that returns to your store (redirect mode).
- UPI, cards, netbanking, wallets, EMI and Pay Later: choose which ones are offered.
- Works with the classic checkout and the WooCommerce Cart and Checkout blocks.
- Every payment is checked on the server: Razorpay's signature, the order it belongs to, and its amount and currency, before the order is marked paid.
- Optional manual capture: authorized payments put the order on hold until you capture them from the order screen.
- Full and partial refunds from WooCommerce. Refunds made in the Razorpay Dashboard are recorded on the order.
- Payment links (email and SMS) for any unpaid order, from the order screen.

Subscriptions

- Works with MemberSutra (free and Pro) and with WooCommerce Subscriptions.
- A subscription runs as a Razorpay Subscription whenever every renewal costs the same. The first payment can differ (sign-up fee, trial, coupon, tax, other items in the cart): it is collected when the customer authorizes the subscription, and Razorpay starts charging the plan price on the first renewal date.
- Each subscription is linked to the shopper's Razorpay customer (created once and reused for later purchases).

- When renewal prices change over time (for example, a discount for the first few renewals), the first payment is taken with Razorpay and each renewal is invoiced by your store, payable with Razorpay. The order notes say why.
- Cancelling, pausing and resuming on your store is applied in Razorpay. Razorpay renewals, failed charges and cancellations made in the Razorpay Dashboard are recorded on your store.
- Razorpay plans are created automatically (one per distinct price and interval), or you can set a Plan ID on a WooCommerce Subscriptions product.

More ways to sell (1.3)

- Razorpay Magic Checkout (India): "Buy now" on product pages and one-click checkout from the cart, with the customer's address, your shipping methods, your coupons and optional cash on delivery handled in Razorpay.
- Bank transfer: each order can get its own account and UPI ID; the order is paid automatically when the money arrives.
- Route: send a share of each sale to linked accounts (marketplaces, vendors), held until you release it if you like.
- Razorpay's Affordability Widget (EMI, cardless EMI, Pay Later, offers) and the Trusted Business badge on product pages.
- Payment links, disputes and failed refunds followed by webhook; disputed orders go on hold and back when you win.
- WooCommerce Subscriptions: store-invoiced subscriptions can have their amount and dates changed, customers can switch to Razorpay, and several subscriptions can be bought together; moving a Razorpay-billed subscription to another method cancels it in Razorpay.
- 100+ currencies (Razorpay international payments), Malaysian (Curlec) accounts, a custom thank-you message, WooCommerce Pre-Orders (charged upfront), CheckoutWC, FunnelKit and WPML.

Webhooks

- Verified with your webhook secret (HMAC-SHA256), and each event is handled once, even when Razorpay delivers it twice at the same moment.
- Set up automatically from the Webhooks screen (every event and a new secret), or by hand in the Razorpay Dashboard.
